Introduction @WERATEDOGS

It's a famous twitter account where people post a pictures and funny comments account to answer some question about this account , like when did people start pay attention to dogs ?

When did people pay attention to dogs ?

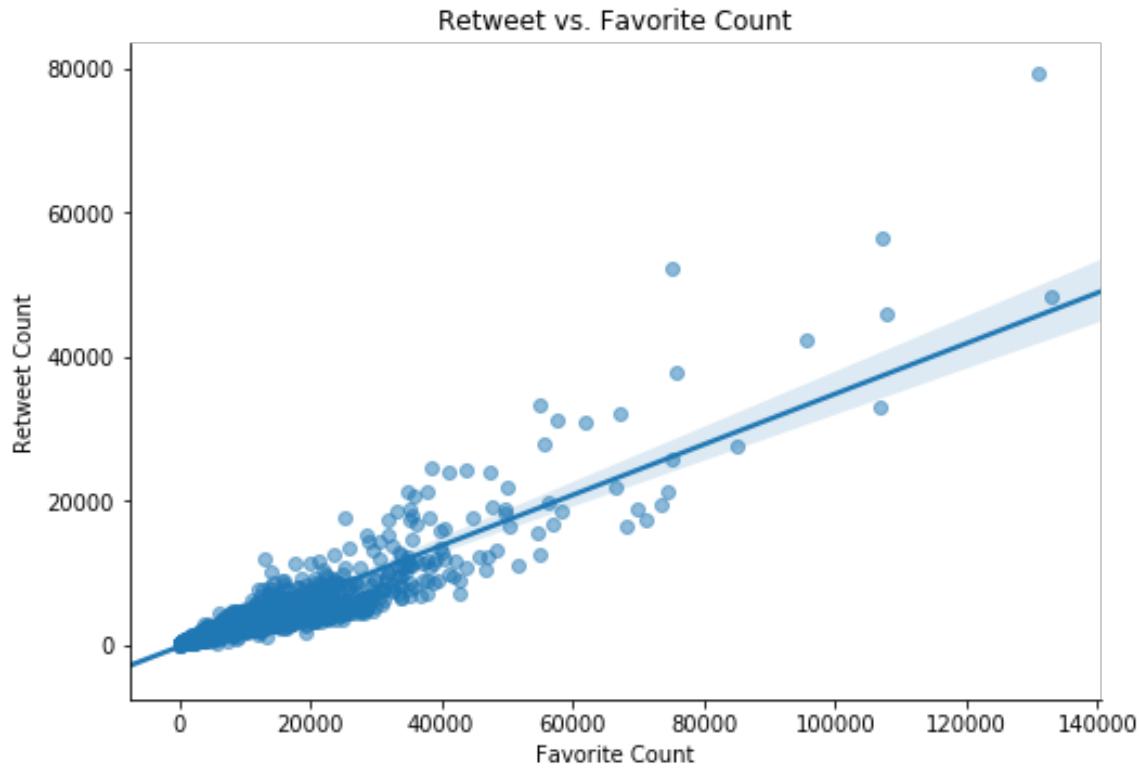

First , after I collect all the data from three different resource and finalize it in one clean dataset , I use line graph to show the relation of rating over time .. then I noticed that there are some outliers , so this graph hadn't give me the right answer , so I drop off the outliers .

After dropping the outliers we can see now!! That people start pay attention to dogs and rating them at the end of 2015 , while the account was created at November 2015 .. which means that the people were really into the dogs from before , in my opinion the account was created because of this " people really likes dogs " , and that's why the rating have a great scores from the beginning of creating this account.

Dose the retweet affect the favorite number or not ?

After I investigate the favorite and retweet count I have collected from all the recourses before using scatter plot , I noticed that " YES " retweet numbers dose effect favorite number since when the retweet increase the favorite increases too .. which cause a positive correlation between them.
